*A top quality book along with the typeface employed was interesting to learn. It is one of the most amazing book we have study. I discovered this pdf from my i and dad recommended this book to learn.*

Not illustrated. 1900 Excerpt: .t) t where (c)<sub>j</sub> is a regular function of and i in the immediate vicinity of t=0, v = 0. Now the required integral v is to vanish with t; take a point 0 near t=0, and let the value of v there be -0. Join t to the origin by a curve, which is of finite length and does not make an infinite number of circuits round the origin; and integrate along this curve from t to t. We have  $v = \int_{t_0}^t J e^{-Tt} + t \omega v, J e^{-rt} + u \omega c a) = b \log_{-+} (c), dt. t \text{ to } t \text{ J fa As } (c)1$  is a regular function of t and v, then, if the variable v be such as to have only definite finite values along the curve of integration, the integral is a finite quantity, say E; and therefore  $v = e^{-rt} + v, +tOv) = b \log t + A + E, F. II. 11$  where A is a constant, depending upon v<sub>0</sub> and t<sub>0</sub>. Hence finally  $v = bt \log t e^{-rt} + (At + Et) e^{-r - 8W} = bt \log t + (At + Et) e^{-rt} + bt \log t e^{-r - tG - l}$ . Now when t is a small quantity, so also is t log t; for if Log t denote that branch of the logarithmic function the argument of which lies between 0 and 2tt, then  $1 \log t = t \log t + t^2 k_{irj}$ , where k is a finite integer on account of the properties of the curve drawn through...
