Not illustrated. 1916 Excerpt: . . . of bearing of the chords are nearly opposite each other, so that the resulting pin moment is still mainly dependent upon the difference in chord stress, or maximum diagonal stress, as in the other case. (See Chapter VIII for examples of pin calculation.) The maximum bending moment being known, the pin diameter is determined from the usual formula for fibre stress in beams, $M = cI\sigma$. In this case $c = r$, and $I = \frac{\pi r^4}{4}$. Expressing the result in terms of the diameter D we have $10.2 MD$ and $D = \sqrt[3]{10.2 M / \sigma}$. Tables of resisting moments for various unit stresses and pin sizes are given in the handbooks. The allowable bending stress in pins may be taken fairly high, 24,000 lbs. per sq. in. in the Specifications, Appendix A. This is for the reason that the assumption of concentrated loads made in the calculations gives higher values than the true moments, and for the further reason that any slight bending of the pin results in some readjustment of the forces acting thereon, which tends to reduce the moments. The pin is also not subject to large additional stresses of a secondary nature, as is the case with the members themselves. The unit stresses employed are the result of many years, experience of bridge engineers in the behavior of bridges long in service. (3) Bearing Stresses. --The bearing stress on pins is taken, as in the case of rivets, at...
